Part \# I : Multiple Choice

4. Hydrolysis of acid derivative is an $\mathrm{S}_{\mathrm{N}} 2 \mathrm{Th}$ reaction and the reactivity of acid derivatives towards $\mathrm{S}_{\mathrm{N}} 2 \mathrm{Th}$ is

5. It is Fisher esterification reaction.

## Part \# II : Assertion \& Reason

7. $\quad \mathrm{S}_{\mathrm{N}} 2 \mathrm{Th}$ is a sterically as well as electronically controlled reaction i.e., steric crowding around acyl carbon decreases rate of reaction and inerease in +ve charge centre around acyl carbon increases rate of reaction:
8. 

 Nucleophilic attack is difficult.
13. Boiling point a molecular mass $\alpha$ intermolecular H -bonding.

(B) it is an acid catalysed esterification.
(C) it is an acid catalysed hydrolysis.
(D) It is a base catalysed hydrolysis which is also known as saponification

## Part \# II : Comprehension

Comprehension \#1:

1. Hoffmann rearrangement is shown by $1^{\circ}$ amide only.
2. Rate of reaction in hoffmann rearrangement among different amide depends on migratory aptitude of group in the amide.
3. Hoffmann rearrangement is $100 \%$ intramolecular. one amide will give only one amine with $\mathrm{Br}_{2} / \mathrm{OH}^{\Theta}$.

Comprehension \# 2 :

1. $\quad \mathrm{Z}$ is $\mathrm{Ph}-\mathrm{C}-\mathrm{CH}_{2}-\mathrm{COOH}$
2. $\quad \mathrm{X}$ is an anion and it has no acidic hydrogen.
3. any mono substituted benzene oxidises to benzoic acid.

Comprehension \#3:

20.

21. Benzoic acid and Ethyl benzoate can be distinguished by sodium bicarbonate test.

Sodium bicarbonate test :
Acids react with $\mathrm{NaHCO}_{3}$ to produce brisk effervescence due to the evolution of $\mathrm{CO}_{2}$ gas.
Benzoic acid being an acid responds to this test, but ethylbenzoate does not.

$$
\begin{aligned}
& \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COOH}+\mathrm{NaHCO}_{3} \longrightarrow \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{COONa}+\mathrm{CO}_{2} \uparrow+\mathrm{H}_{2} \mathrm{O} \\

26. $\underset{\substack{\text { Acetic acid }} \mathrm{CH}_{3} \mathrm{COOH}}{\text { A }} \mathrm{NH}_{3} \xrightarrow{\text { heat }} \mathrm{CH}_{3} \mathrm{CONH}_{2} \xrightarrow{\mathrm{LiAlH}_{4}} \underset{\text { Ethanamine }}{\mathrm{CH}_{3} \mathrm{CH}_{2} \mathrm{NH}_{2}}$
27. $\mathrm{Cl}-\mathrm{CH}_{2}-\mathrm{CH}_{2}-\mathrm{COOH}$ has least -I group and hence smallest acid dissociation constant.
28. Electron-donating groups decrease the strengths of acids, while electron-withdrawing groups increase the strengths of acids. As methoxy group is an electron-donating group, 4-methoxybenzoic acid is a weaker acid than benzoic acid. Nitro group is an electron-withdrawing group and will increase the strengths of acids. As 3,4-dinitrobenzoic acid contains two nitro groups, it is a slightly stronger acid than 4-nitrobenzoic acid. Hence, the strengths of the given acids increase as :
3,4-Dinitrobenzoic acid $>4$-Nitrobenzoic acid $>$ Benzoic acid $>4$-Methoxybenzoic acid.
29. Phenol and benzoic acid can be distinguished by ferric chloride test.

Ferric chloride test :
Phenol reacts with neutral $\mathrm{FeCl}_{3}$ to form an iron-phenol complex giving violet colouration
$6 \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{OH}+\mathrm{FeCl}_{3} \longrightarrow\left[\mathrm{Fe}\left(\mathrm{OC}_{6} \mathrm{H}_{5}\right)_{6}\right]^{3-}+3 \mathrm{H}^{+}+3 \mathrm{Cl}^{-}$
Phenol Iron-phenol complex

But benzoic acid reacts with neutral $\mathrm{FeCl}_{3}$ to give a buff coloured ppt. of ferric benzoate

Carboxylic acid Alcohol
If either water or ester is not removed as soon as it is formed, then it reacts to give back the reactants as the reaction is reversible. Therefore, to shift the equilibrium in the forward direction i.e., to produce more ester, either of the two should be removed.
38. An organic compound (A) with molecular formula $\mathrm{C}_{8} \mathrm{H}_{16} \mathrm{O}_{2}$ gives a carboxylic acid (B) and an alcohol (C) on hydrolysis with dilute sulphuric acid. Thus, compound (A) must be an ester. Further, alcohol (C) gives acid (B) on oxidation with chromic acid. Thus, ( $\mathbf{B}$ ) and ( $\mathbf{C}$ ) must contain equal number of carbon atoms.
Since compound (A) contains a total of 8 carbon atoms, each of $(B)$ and $(C)$ contain 4 carbon atoms.
Again, on dehydration, alcohol (C) gives but-1-ene. Therefore, (C) is of straight chain and hence, it is butan-1-ol.
