

# **COMPLEX NUMBERS AND QUADRATIC EQUATIONS**

## **5.1 Overview**

We know that the square of a real number is always non-negative e.g.  $(4)^2 = 16$  and  $(-4)^2 = 16$ . Therefore, square root of 16 is  $\pm 4$ . What about the square root of a negative number? It is clear that a negative number can not have a real square root. So we need to extend the system of real numbers to a system in which we can find out the square roots of negative numbers. Euler (1707 - 1783) was the first mathematician to

introduce the symbol *i* (iota) for positive square root of -1 i.e.,  $i = \sqrt{-1}$ .

## 5.1.1 Imaginary numbers

Square root of a negative number is called an imaginary number, for example,

$$\sqrt{-9} = \sqrt{-1}\sqrt{9} = i3, \sqrt{-7} = \sqrt{-1}\sqrt{7} = i\sqrt{7}$$

## 5.1.2 Integral powers of i

$$i = \sqrt{-1}, i^2 = -1, i^3 = i^2 i = -i, i^4 = (i^2)^2 = (-1)^2 = 1.$$

To compute  $i^n$  for n > 4, we divide n by 4 and write it in the form n = 4m + r, where m is quotient and *r* is remainder  $(0 \le r \le 4)$ 

and

$$i^{n} = i^{4m+r} = (i^{4})^{m} \cdot (i)^{r} = (1)^{m} (i)^{r} = i^{r}$$

$$(i)^{39} = i^{4 \times 9+3} = (i^{4})^{9} \cdot (i)^{3} = i^{3} = -i$$

$$)^{-435} = i^{-(4 \times 108+3)} = (i)^{-(4 \times 108)} \cdot (i)^{-3}$$

For example,

$$(i)^{-435} = i^{-(4 \times 108)}$$

$$\frac{1}{(i^4)^{108}} \cdot \frac{1}{(i)^3} = \frac{i}{(i)^4} = i$$

(i) If a and b are positive real numbers, then

$$\sqrt{-a} \times \sqrt{-b} = \sqrt{-1}\sqrt{a} \times \sqrt{-1}\sqrt{b} = i\sqrt{a} \times i\sqrt{b} = -\sqrt{ab}$$

(ii)  $\sqrt{a} \cdot \sqrt{b} = \sqrt{ab}$  if a and b are positive or at least one of them is negative or zero. However,  $\sqrt{a}\sqrt{b} \neq \sqrt{ab}$  if a and b, both are negative.

## 5.1.3 Complex numbers

- (a) A number which can be written in the form a + ib, where a, b are real numbers and  $i = \sqrt{-1}$  is called a complex number.
- (b) If z = a + ib is the complex number, then *a* and *b* are called real and imaginary parts, respectively, of the complex number and written as  $\operatorname{Re}(z) = a$ ,  $\operatorname{Im}(z) = b$ .
- (c) Order relations "greater than" and "less than" are not defined for complex numbers.
- (d) If the imaginary part of a complex number is zero, then the complex number is known as purely real number and if real part is zero, then it is called purely imaginary number, for example, 2 is a purely real number because its imaginary part is zero and 3*i* is a purely imaginary number because its real part is zero.

## 5.1.4 Algebra of complex numbers

- (a) Two complex numbers  $z_1 = a + ib$  and  $z_2 = c + id$  are said to be equal if a = c and b = d.
- (b) Let  $z_1 = a + ib$  and  $z_2 = c + id$  be two complex numbers then  $z_1 + z_2 = (a + c) + i (b + d)$ .

## 5.1.5 Addition of complex numbers satisfies the following properties

- 1. As the sum of two complex numbers is again a complex number, the set of complex numbers is closed with respect to addition.
- 2. Addition of complex numbers is commutative, i.e.,  $z_1 + z_2 = z_2 + z_1$
- 3. Addition of complex numbers is associative, i.e.,  $(z_1 + z_2) + z_3 = z_1 + (z_2 + z_3)$
- 4. For any complex number z = x + i y, there exist 0, i.e., (0 + 0i) complex number such that z + 0 = 0 + z = z, known as identity element for addition.
- 5. For any complex number z = x + iy, there always exists a number -z = -a ib such that z + (-z) = (-z) + z = 0 and is known as the additive inverse of z.

## 5.1.6 Multiplication of complex numbers

Let  $z_1 = a + ib$  and  $z_2 = c + id$ , be two complex numbers. Then

 $z_1 \cdot z_2 = (a + ib) (c + id) = (ac - bd) + i (ad + bc)$ 

- 1. As the product of two complex numbers is a complex number, the set of complex numbers is closed with respect to multiplication.
- 2. Multiplication of complex numbers is commutative, i.e.,  $z_1 \cdot z_2 = z_2 \cdot z_1$
- 3. Multiplication of complex numbers is associative, i.e.,  $(z_1.z_2) \cdot z_3 = z_1 \cdot (z_2.z_3)$

4. For any complex number z = x + iy, there exists a complex number 1, i.e., (1 + 0i) such that

 $z \cdot 1 = 1 \cdot z = z$ , known as identity element for multiplication.

5. For any non zero complex number z = x + i y, there exists a complex number  $\frac{1}{2}$ 

such that  $z \cdot \frac{1}{z} = \frac{1}{z} \cdot z = 1$ , i.e., multiplicative inverse of  $a + ib = \frac{1}{a + ib} = \frac{a - ib}{a^2 + b^2}$ .

6. For any three complex numbers  $z_1$ ,  $z_2$  and  $z_3$ ,

$$z_1 \cdot (z_2 + z_3) = z_1 \cdot z_2 + z_1 \cdot z_3$$
  
(z\_1 + z\_2) \cdot z\_3 = z\_1 \cdot z\_3 + z\_2 \cdot z\_3

and

i.e., for complex numbers multiplication is distributive over addition.

**5.1.7** Let  $z_1 = a + ib$  and  $z_2 \neq 0 = c + id$ . Then

$$z_1 \div z_2 = \frac{z_1}{z_2} = \frac{a+ib}{c+id} = \frac{(ac+bd)}{c^2+d^2} + i\frac{(bc-ad)}{c^2+d^2}$$

## 5.1.8 Conjugate of a complex number

Let z = a + ib be a complex number. Then a complex number obtained by changing the sign of imaginary part of the complex number is called the conjugate of z and it is denoted by  $\overline{z}$ , i.e.,  $\overline{z} = a - ib$ .

Note that additive inverse of z is -a - ib but conjugate of z is a - ib.

We have :

1.  $\overline{(\overline{z})} = z$ 

2. 
$$z + \overline{z} = 2 \operatorname{Re}(z), z - \overline{z} = 2 i \operatorname{Im}(z)$$

- 3.  $z = \overline{z}$ , if z is purely real.
- 4.  $z + \overline{z} = 0 \Leftrightarrow z$  is purely imaginary
- 5.  $z \cdot \overline{z} = {\operatorname{Re}(z)}^2 + {\operatorname{Im}(z)}^2$ .

6. 
$$(z_1+z_2) = \overline{z_1} + \overline{z_2}, (z_1-z_2) = \overline{z_1} - \overline{z_2}$$

7. 
$$(\overline{z_1 \cdot z_2}) = (\overline{z_1}) \ (\overline{z_2}), \ \left(\frac{\overline{z_1}}{\overline{z_2}}\right) = \frac{(\overline{z_1})}{(\overline{z_2})} \ (\overline{z_2} \neq 0)$$

## 5.1.9 Modulus of a complex number

Let z = a + ib be a complex number. Then the positive square root of the sum of square of real part and square of imaginary part is called modulus (absolute value) of z and it is denoted by |z| i.e.,  $|z| = \sqrt{a^2 + b^2}$ 

In the set of complex numbers  $z_1 > z_2$  or  $z_1 < z_2$  are meaningless but

 $|z_1| > |z_2|$  or  $|z_1| < |z_2|$ 

are meaningful because  $|z_1|$  and  $|z_2|$  are real numbers.

5.1.10 Properties of modulus of a complex number

1.  $|z| = 0 \iff z = 0$  i.e., Re (z) = 0 and Im (z) = 0

2. 
$$|z| = |\overline{z}| = |-z|$$
  
3.  $-|z| \le \operatorname{Re}(z) \le |z| \text{ and } -|z| \le \operatorname{Im}(z) \le |z|$   
4.  $z \ \overline{z} = |z|^2, \ |z^2| = |\overline{z}|^2$   
5.  $|z_1 z_2| = |z_1| \cdot |z_2|, \ \frac{|z_1|}{|z_2|} = \frac{|z_1|}{|z_2|} (z_2 \ne 0)$   
6.  $|z_1 + z_2|^2 = |z_1|^2 + |z_2|^2 + 2\operatorname{Re}(z_1 \overline{z}_2)$   
7.  $|z_1 - z_2|^2 = |z_1|^2 + |z_2|^2 - 2\operatorname{Re}(z_1 \overline{z}_2)$   
8.  $|z_1 + z_2| \le |z_1| + |z_2|$ 

9. 
$$|z_1 - z_2| \ge |z_1| - |z_2|$$

10.  $|az_1 - bz_2|^2 + |bz_1 + az_2|^2 = (a^2 + b^2) (|z_1|^2 + |z_2|^2)$ In particular:

 $|z_1 - z_2|^2 + |z_1 + z_2|^2 = 2(|z_1|^2 + |z_2|^2)$ 

11. As stated earlier multiplicative inverse (reciprocal) of a complex number  $z = a + ib \ (\neq 0)$  is

$$\frac{1}{z} = \frac{a-ib}{a^2+b^2} = \frac{\overline{z}}{\left|z\right|^2}$$

## 5.2 Argand Plane

A complex number z = a + ib can be represented by a unique point P (a, b) in the cartesian plane referred to a pair of rectangular axes. The complex number 0 + 0i represent the origin 0 (0, 0). A purely real number a, i.e., (a + 0i) is represented by the point (a, 0) on x - axis. Therefore, x-axis is called real axis. A purely imaginary number

*ib*, i.e., (0 + ib) is represented by the point (0, b) on y-axis. Therefore, y-axis is called imaginary axis.

Similarly, the representation of complex numbers as points in the plane is known as **Argand diagram**. The plane representing complex numbers as points is called complex plane or Argand plane or Gaussian plane.

If two complex numbers  $z_1$  and  $z_2$  be represented by the points P and Q in the complex plane, then

$$|z_1 - z_2| = PQ$$

## 5.2.1 Polar form of a complex number

Let P be a point representing a non-zero complex number z = a + ib in the Argand plane. If OP makes an angle  $\theta$  with the positive direction of x-axis, then  $z = r (\cos \theta + i \sin \theta)$  is called the polar form of the complex number, where

 $r = |z| = \sqrt{a^2 + b^2}$  and  $\tan \theta = \frac{b}{a}$ . Here  $\theta$  is called argument or amplitude of z and we

write it as arg  $(z) = \theta$ .

The unique value of  $\theta$  such that  $-\pi \le \theta \le \pi$  is called the principal argument.

$$\arg (z_1 \cdot z_2) = \arg (z_1) + \arg (z_2)$$
$$\arg \left(\frac{z_1}{z_2}\right) = \arg (z_1) - \arg (z_2)$$

## 5.2.2 Solution of a quadratic equation

The equations  $ax^2 + bx + c = 0$ , where *a*, *b* and *c* are numbers (real or complex,  $a \neq 0$ ) is called the general quadratic equation in variable*x*. The values of the variable satisfying the given equation are called roots of the equation.

The quadratic equation  $ax^2 + bx + c = 0$  with real coefficients has two roots given

by 
$$\frac{-b+\sqrt{D}}{2a}$$
 and  $\frac{-b-\sqrt{D}}{2a}$ , where  $D=b^2-4ac$ , called the discriminant of the equation.

Notes

1. When D = 0, roots of the quadratic equation are real and equal. When D > 0, roots are real and unequal.

Further, if  $a, b, c \in \mathbf{Q}$  and D is a perfect square, then the roots of the equation are rational and unequal, and if  $a, b, c \in \mathbf{Q}$  and D is not a perfect square, then the roots are irrational and occur in pair.

When D < 0, roots of the quadratic equation are non real (or complex).

2. Let  $\alpha$ ,  $\beta$  be the roots of the quadratic equation  $ax^2 + bx + c = 0$ , then sum of the roots

$$(\alpha + \beta) = \frac{-b}{a}$$
 and the product of the roots  $(\alpha \cdot \beta) = \frac{c}{a}$ 

3. Let S and P be the sum of roots and product of roots, respectively, of a quadratic equation. Then the quadratic equation is given by  $x^2 - Sx + P = 0$ .

## 5.2 Solved Exmaples

#### **Short Answer Type**

Example 1 Evaluate :  $(1 + i)^6 + (1 - i)^3$ Solution  $(1 + i)^6 = \{(1 + i)^2\}^3 = (1 + i^2 + 2i)^3 = (1 - 1 + 2i)^3 = 8i^3 = -8i$ and  $(1 - i)^3 = 1 - i^3 - 3i + 3i^2 = 1 + i - 3i - 3 = -2 - 2i$ Therefore,  $(1 + i)^6 + (1 - i)^3 = -8i - 2 - 2i = -2 - 10i$ 

**Example 2** If  $(x+iy)^{\frac{1}{3}} = a+ib$ , where  $x, y, a, b \in \mathbb{R}$ , show that  $\frac{x}{a} - \frac{y}{b} = -2(a^2 + b^2)$ 

Solution 
$$(x+iy)^{\frac{1}{3}} = a + ib$$
  

$$\Rightarrow \qquad x + iy = (a + ib)^{3}$$
i.e.,  $x + iy = a^{3} + i^{3}b^{3} + 3iab(a + ib)$   
 $= a^{3} - ib^{3} + i3a^{2}b - 3ab^{2}$   
 $= a^{3} - 3ab^{2} + i(3a^{2}b - b^{3})$   
 $\Rightarrow \qquad x = a^{3} - 3ab^{2} \text{ and } y = 3a^{2}b - b^{3}$   
 $\frac{x}{2} \qquad y$ 

Thus

$$\frac{x}{a} = a^2 - 3b^2$$
 and  $\frac{y}{b} = 3a^2 - b^2$ 

So,

$$\frac{x}{a} - \frac{y}{b} = a^2 - 3b^2 - 3a^2 + b^2 = -2 \ a^2 - 2b^2 = -2 \ (a^2 + b^2).$$

**Example 3** Solve the equation  $z^2 = \overline{z}$ , where z = x + iy **Solution**  $z^2 = \overline{z} \implies x^2 - y^2 + i2xy = x - iy$ Therefore,  $x^2 - y^2 = x$  ... (1) and 2xy = -y ... (2) From (2), we have y = 0 or  $x = -\frac{1}{2}$ When y = 0, from (1), we get  $x^2 - x = 0$ , i.e., x = 0 or x = 1. When  $x = -\frac{1}{2}$ , from (1), we get  $y^2 = \frac{1}{4} + \frac{1}{2}$  or  $y^2 = \frac{3}{4}$ , i.e.,  $y = \pm \frac{\sqrt{3}}{2}$ . Hence, the solutions of the given equation are

$$0 + i0, 1 + i0, -\frac{1}{2} + i\frac{\sqrt{3}}{2}, -\frac{1}{2} - i\frac{\sqrt{3}}{2}$$

**Example 4** If the imaginary part of  $\frac{2z+1}{iz+1}$  is -2, then show that the locus of the point representing z in the argand plane is a straight line.

**Solution** Let z = x + iy. Then

$$\frac{2z+1}{iz+1} = \frac{2(x+iy)+1}{i(x+iy)+1} = \frac{(2x+1)+i2y}{(1-y)+ix}$$
$$= \frac{\{(2x+1)+i2y\}}{\{(1-y)+ix\}} \times \frac{\{(1-y)-ix\}}{\{(1-y)-ix\}}$$
$$= \frac{(2x+1-y)+i(2y-2y^2-2x^2-x)}{1+y^2-2y+x^2}$$

 $2x^2$ 

$$\operatorname{Im}\left(\frac{2z+1}{iz+1}\right) = \frac{2y-2y^2-2x^2-x}{1+y^2-2y+x^2}$$

But

Thus

$$\operatorname{Im}\left(\frac{2z+1}{iz+1}\right) = -2 \qquad \text{(Given)}$$

 $\frac{2y-2y^2-2x^2-x}{2} = -2$ 

So  $\Rightarrow$ 

i.e.,

$$\begin{array}{l}
1+y - 2y + x \\
2y - 2y^2 - 2x^2 - x = -2 \\
x + 2y - 2 = 0, \text{ which is the equation of a line.}
\end{array}$$

**Example 5** If  $|z^2 - 1| = |z|^2 + 1$ , then show that z lies on imaginary axis. **Solution** Let z = x + iy. Then  $|z^2 - 1| = |z|^2 + 1$ 

 $\Rightarrow |x^2 - y^2 - 1 + i 2xy| = |x + iy|^2 + 1$   $\Rightarrow (x^2 - y^2 - 1)^2 + 4x^2y^2 = (x^2 + y^2 + 1)^2$   $\Rightarrow 4x^2 = 0 i.e., x = 0$ Hence z lies on y-axis.

**Example 6** Let  $z_1$  and  $z_2$  be two complex numbers such that  $\overline{z_1} + i \overline{z_2} = 0$  and arg  $(z_1, z_2) = \pi$ . Then find arg  $(z_1)$ .

**Solution** Given that  $\overline{z_1} + i \overline{z_2} = 0$ 

⇒ Thus	$z_1 = i z_2$ , i.e., $z_2 = -i z_1$ arg $(z_1 z_2) = \arg z_1 + \arg (-i z_1) = \pi$
$\Rightarrow$	$\arg(-iz_1^2) = \pi$
$\Rightarrow$	$\arg(-i) + \arg(z_1^2) = \pi$
$\Rightarrow$	$\arg(-i) + 2\arg(z_1) = \pi$
$\Rightarrow$	$\frac{-\pi}{2} + 2 \arg(z_1) = \pi$
$\Rightarrow$	$\arg(z_1) = \frac{3\pi}{4}$

**Example 7** Let  $z_1$  and  $z_2$  be two complex numbers such that  $|z_1 + z_2| = |z_1| + |z_2|$ . Then show that  $\arg(z_1) - \arg(z_2) = 0$ .

Solution Let  $z_1 = r_1 (\cos \theta_1 + i \sin \theta_1)$  and  $z_2 = r_2 (\cos \theta_2 + i \sin \theta_2)$ where  $r_1 = |z_1|$ , arg  $(z_1) = \theta_1$ ,  $r_2 = |z_2|$ , arg  $(z_2) = \theta_2$ . We have,  $|z_1 + z_2| = |z_1| + |z_2|$   $= |r_1 (\cos \theta_1 + \cos \theta_2) + r_2 (\cos \theta_2 + \sin \theta_2)| = r_1 + r_2$   $= r_1^2 + r_2^2 + 2r_1r_2 \cos(\theta_1 - \theta_2) = (r_1 + r_2)^2 \Rightarrow \cos(\theta_1 - \theta_2) = 1$   $\Rightarrow \theta_1 - \theta_2$  i.e. arg  $z_1 = \arg z_2$ Example 8 If  $z_1, z_2, z_3$  are complex numbers such that

 $|z_1| = |z_2| = |z_3| = \left|\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3}\right| = 1$ , then find the value of  $|z_1 + z_2 + z_3|$ . Solution  $|z_1| = |z_2| = |z_3| = 1$   $\Rightarrow$ 

 $\Rightarrow$ 

$$|z_1|^2 = |z_2|^2 = |z_3|^2 = 1$$
  
$$z_1 \overline{z_1} = z_2 \overline{z_2} = z_3 \overline{z_2} = 1$$

$$\overline{z_1} = \frac{1}{z_1}, \ \overline{z_2} = \frac{1}{z_2}, \ \overline{z_3} = \frac{1}{z_3}$$

 $\left|\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_2}\right| = 1$ Given that

$$\Rightarrow \qquad |\overline{z_1} + \overline{z_2} + \overline{z_3}| = 1 \text{, i.e., } |\overline{z_1} + z_2 + z_3| = 1$$
$$\Rightarrow \qquad |z_1 + z_2 + z_3| = 1$$

 $\Rightarrow$ 

**Example 9** If a complex number z lies in the interior or on the boundary of a circle of radius 3 units and centre (-4, 0), find the greatest and least values of |z+1|.

Solution Distance of the point representing z from the centre of the circle is |z - (-4 + i0)| = |z + 4|.

According to given condition  $|z+4| \le 3$ .

Now  $|z+1| = |z+4-3| \le |z+4| + |-3| \le 3+3=6$ 

Therefore, greatest value of |z + 1| is 6.

Since least value of the modulus of a complex number is zero, the least value of |z+1|=0.

**Example 10** Locate the points for which 3 < |z| < 4

Solution  $|z| < 4 \Rightarrow x^2 + y^2 < 16$  which is the interior of circle with centre at origin and radius 4 units, and  $|z| > 3 \Rightarrow x^2 + y^2 > 9$  which is exterior of circle with centre at origin and radius 3 units. Hence 3 < |z| < 4 is the portion between two circles  $x^2 + y^2 = 9$  and  $x^2 + y^2 = 16.$ 

**Example 11** Find the value of  $2x^4 + 5x^3 + 7x^2 - x + 41$ , when  $x = -2 - \sqrt{3}i$ **Solution**  $x + 2 = -\sqrt{3}i \implies x^2 + 4x + 7 = 0$  $2x^4 + 5x^3 + 7x^2 - x + 41 = (x^2 + 4x + 7)(2x^2 - 3x + 5) + 6$ Therefore  $= 0 \times (2x^2 - 3x + 5) + 6 = 6.$ 

**Example 12** Find the value of P such that the difference of the roots of the equation  $x^2 - Px + 8 = 0$  is 2.

**Solution** Let  $\alpha$ ,  $\beta$  be the roots of the equation  $x^2 - Px + 8 = 0$ Therefore  $\alpha + \beta = P$  and  $\alpha \cdot \beta = 8$ .

Now

$$\alpha - \beta = \pm \sqrt{(\alpha + \beta)^2 - 4\alpha\beta}$$

Therefore  $2 = \pm \sqrt{P^2 - 32}$ 

 $\Rightarrow \qquad P^2 - 32 = 4, \text{ i.e., } P = \pm 6.$ 

**Example 13** Find the value of *a* such that the sum of the squares of the roots of the equation  $x^2 - (a-2)x - (a+1) = 0$  is least.

**Solution** Let  $\alpha$ ,  $\beta$  be the roots of the equation

Therefore,  $\alpha + \beta = a - 2$  and  $\alpha\beta = -(a + 1)$ Now  $\alpha^2 + \beta^2 = (\alpha + \beta)^2 - 2\alpha\beta$  $= (a - 2)^2 + 2 (a + 1)$  $= (a - 1)^2 + 5$ 

Therefore,  $\alpha^2 + \beta^2$  will be minimum if  $(a - 1)^2 = 0$ , i.e., a = 1.

## Long Answer Type

**Example 14** Find the value of k if for the complex numbers  $z_1$  and  $z_2$ ,

$$|1-\overline{z_1}z_2|^2 - |z_1-z_2|^2 = k(1-|z_1|^2)(1-|z_2|^2)$$

**Solution** 

L.H.S. = 
$$|1 - \overline{z_1} z_2|^2 - |z_1 - z_2|^2$$
  
=  $(1 - \overline{z_1} z_2) (\overline{1 - \overline{z_1} z_2}) - (z_1 - z_2) (\overline{z_1 - z_2})$   
=  $(1 - \overline{z_1} z_2) (1 - z_1 \overline{z_2}) - (z_1 - z_2) (\overline{z_1} - \overline{z_2})$   
=  $1 + z_1 \overline{z_1} z_2 \overline{z_2} - z_1 \overline{z_1} - z_2 \overline{z_2}$   
=  $1 + |z_1|^2 \cdot |z_2|^2 - |z_1|^2 - |z_2|^2$   
=  $(1 - |z_1|^2) (1 - |z_2|^2)$   
R.H.S. =  $k (1 - |z_1|^2) (1 - |z_2|^2)$   
 $k = 1$ 

 $\Rightarrow$ 

Hence, equating LHS and RHS, we get 
$$k = 1$$
.  
Example 15 If  $z_1$  and  $z_2$  both satisfy  $z + \overline{z} = 2|z-1|$  arg  $(z_1 - z_2) = \frac{\pi}{4}$ , then find Im  $(z_1 + z_2)$ .  
Solution Let  $z = x + iy$ ,  $z_1 = x_1 + iy_1$  and  $z_2 = x_2 + iy_2$ .  
Then  $z + \overline{z} = 2|z-1|$   
 $\Rightarrow (x + iy) + (x - iy) = 2|x-1+iy|$   
 $\Rightarrow 2x = 1 + y^2$  ... (1)  
Since  $z_1$  and  $z_2$  both satisfy (1), we have  
 $2x_1 = 1 + y_1^2$  ... and  $2x_2 = 1 + y_2^2$   
 $\Rightarrow 2(x_1 - x_2) = (y_1 + y_2)(y_1 - y_2)$   
 $\Rightarrow 2 = (y_1 + y_2) \left(\frac{y_1 - y_2}{x_1 - x_2}\right)$  ... (2)  
Again  $z_1 - z_2 = (x_1 - x_2) + i(y_1 - y_2)$   
Therefore,  $\tan \theta = \frac{y_1 - y_2}{x_1 - x_2}$ , where  $\theta = \arg(z_1 - z_2)$   
 $\Rightarrow \tan \frac{\pi}{4} = \frac{y_1 - y_2}{x_1 - x_2}$  (since  $\theta = \frac{\pi}{4}$ )  
i.e.,  $1 = \frac{y_1 - y_2}{x_1 - x_2}$   
From (2), we get  $2 = y_1 + y_2$ , i.e., Im  $(z_1 + z_2) = 2$   
Objective Type Questions  
Example 16 Fill in the blanks:  
(i) The reflexion of  $z = z^2$  for which  $2z_1 - 2z_2 + (1 - z)^2 + 5$  is read in

- (i) The real value of 'a' for which  $3i^3 2at^2 + (1 a)i + 5$  is real is \_\_\_\_\_.
- (ii) If |z| = 2 and arg  $(z) = \frac{\pi}{4}$ , then z =\_\_\_\_\_.
- (iii) The locus of z satisfying arg (z) =  $\frac{\pi}{3}$  is \_\_\_\_\_.
- (iv) The value of  $(-\sqrt{-1})^{4n-3}$ , where  $n \in \mathbf{N}$ , is \_\_\_\_\_.

- (v) The conjugate of the complex number  $\frac{1-i}{1+i}$  is \_\_\_\_\_.
- (vi) If a complex number lies in the third quadrant, then its conjugate lies in the \_\_\_\_\_.

(vii) If 
$$(2+i)(2+2i)(2+3i)...(2+ni) = x+iy$$
, then 5.8.13 ...  $(4+n^2) =$ \_\_\_\_\_

## **Solution**

(i)  $3i^3 - 2ai^2 + (1 - a)i + 5 = -3i + 2a + 5 + (1 - a)i$ = 2a + 5 + (-a - 2)i, which is real if -a - 2 = 0 i.e. a = -2. (ii)  $z = |z| \left( \cos \frac{\pi}{4} + i \sin \frac{\pi}{4} \right) = 2 \left( \frac{1}{\sqrt{2}} + i \frac{1}{\sqrt{2}} \right) = \sqrt{2} (1 + i)$ 

(iii) Let 
$$z = x + iy$$
. Then its polar form is  $z = r(\cos \theta + i \sin \theta)$ , where  $\tan \theta = \frac{y}{x}$  and  
 $\theta$  is arg (z). Given that  $\theta = \frac{\pi}{3}$ . Thus.  
 $\tan \frac{\pi}{3} = \frac{y}{x} \implies y = \sqrt{3}x$ , where  $x > 0$ ,  $y > 0$ .  
Hence, locus of z is the part of  $y = \sqrt{3}x$  in the first quadrant except origin.

(iv) Here  $(-\sqrt{-1})^{4n-3} = (-i)^{4n-3} = (-i)^{4n} (-i)^{-3} = \frac{1}{(-i)^3}$  $= \frac{1}{-i^3} = \frac{1}{i} = \frac{i}{i^2} = -i$ (v)  $\frac{1-i}{1+i} = \frac{1-i}{1+i} \times \frac{1-i}{1-i} = \frac{1+i^2-2i}{1-i^2} = \frac{1-1-2i}{1+1} = -i$ 

Hence, conjugate of  $\frac{1-i}{1+i}$  is *i*.

(vi) Conjugate of a complex number is the image of the complex number about the *x*-axis. Therefore, if a number lies in the third quadrant, then its image lies in the second quadrant.

(vii) Given that 
$$(2+i)(2+2i)(2+3i)...(2+ni) = x + iy$$
 ... (1)

$$\Rightarrow (\overline{2+i}) (\overline{2+2i}) (\overline{2+3i}) ... (\overline{2+ni}) = (\overline{x+iy}) = (x-iy)$$
  
i.e.,  $(2-i) (2-2i) (2-3i) ... (2-ni) = x - iy$  ... (2)

Multiplying (1) and (2), we get 5.8.13 ...  $(4 + n^2) = x^2 + y^2$ .

**Example 17** State true or false for the following:

- (i) Multiplication of a non-zero complex number by *i* rotates it through a right angle in the anti- clockwise direction.
- (ii) The complex number  $\cos\theta + i \sin\theta$  can be zero for some  $\theta$ .
- (iii) If a complex number coincides with its conjugate, then the number must lie on imaginary axis.
- (iv) The argument of the complex number  $z = (1 + i\sqrt{3})(1 + i)(\cos \theta + i \sin \theta)$  is  $\frac{7\pi}{12} + \theta$
- (v) The points representing the complex number z for which |z+1| < |z-1| lies in the interior of a circle.
- (vi) If three complex numbers  $z_1$ ,  $z_2$  and  $z_3$  are in A.P., then they lie on a circle in the complex plane.
- (vii) If *n* is a positive integer, then the value of  $i^n + (i)^{n+1} + (i)^{n+2} + (i)^{n+3}$  is 0.

## **Solution**

- (i) True. Let z = 2 + 3i be complex number represented by OP. Then iz = -3 + 2i, represented by OQ, where if OP is rotated in the anticlockwise direction through a right angle, it coincides with OQ.
- (ii) False. Because  $\cos\theta + i\sin\theta = 0 \Rightarrow \cos\theta = 0$  and  $\sin\theta = 0$ . But there is no value of  $\theta$  for which  $\cos\theta$  and  $\sin\theta$  both are zero.
- (iii) False, because  $x + iy = x iy \Rightarrow y = 0 \Rightarrow$  number lies on x-axis.
- (iv) True,  $\arg(z) = \arg(1 + i\sqrt{3}) + \arg(1 + i) + \arg(\cos\theta + i\sin\theta)$

$$\frac{\pi}{3} + \frac{\pi}{4} + \theta = \frac{7\pi}{12} + \theta$$

- (v) False, because |x+iy+1| < |x+iy-1| $\Rightarrow (x+1)^2 + y^2 < (x-1)^2 + y^2$  which gives 4x < 0.
- (vi) False, because if  $z_1, z_2$  and  $z_3$  are in A.P., then  $z_2 = \frac{z_1 + z_3}{2} \Rightarrow z_2$  is the midpoint of  $z_1$  and  $z_3$ , which implies that the points  $z_1, z_2, z_3$  are collinear.

(vii) True, because 
$$i^n + (i)^{n+1} + (i)^{n+2} + (i)^{n+3}$$
  
=  $i^n (1 + i + i^2 + i^3) = i^n (1 + i - 1 - i)$   
=  $i^n (0) = 0$ 

**Example 18** Match the statements of column A and B.

## ColumnA

- (a) The value of  $1+i^2 + i^4 + i^6 + \dots i^{20}$  is
- (b) The value of  $i^{-1097}$  is
- (c) Conjugate of 1+i lies in 1+2i

(d) 
$$\frac{1-i}{1-i}$$
 lies in

- (e) If  $a, b, c \in \mathbb{R}$  and  $b^2 4ac < 0$ , then the roots of the equation  $ax^2 + bx + c = 0$  are non real (complex) and
- (f) If  $a, b, c \in \mathbb{R}$  and  $b^2 4ac > 0$ , and  $b^2 - 4ac$  is a perfect square, then the roots of the equation  $ax^2 + bx + c = 0$

#### Column B

- (i) purely imaginary complex number
- (ii) purely real complex number
- (iii) second quadrant
- (iv) Fourth quadrant
- (v) may not occur in conjugate pairs
- (vi) may occur in conjugate pairs

## **Solution**

(a)  $\Leftrightarrow$  (ii), because  $1 + i^2 + i^4 + i^6 + \dots + i^{20}$ =  $1 - 1 + 1 - 1 + \dots + 1 = 1$  (which is purely a real complex number)

(b) 
$$\Leftrightarrow$$
 (i), because  $i^{-1097} = \frac{1}{(i)^{1097}} = \frac{1}{i^{4 \times 274 + 1}} = \frac{1}{\{(i)^4\}^{274}(i)} = \frac{1}{i} = \frac{i}{i^2} = -i$ 

which is purely imaginary complex number.

(c)  $\Leftrightarrow$  (iv), conjugate of 1 + i is 1 - i, which is represented by the point (1, -1) in the fourth quadrant.

(d) 
$$\Leftrightarrow$$
 (iii), because  $\frac{1+2i}{1-i} = \frac{1+2i}{1-i} \times \frac{1+i}{1+i} = \frac{-1+3i}{2} = -\frac{1}{2} + \frac{3}{2}i$ , which is represented by the point  $\left(-\frac{1}{2}, \frac{3}{2}\right)$  in the second quadrant.

(e) 
$$\Leftrightarrow$$
 (vi), If  $b^2 - 4ac < 0 = D < 0$ , i.e., square root of D is a imaginary  
number, therefore, roots are  $x = \frac{-b \pm \text{Imaginary Number}}{2a}$ , i.e., roots are in  
conjugate pairs.

(f)  $\Leftrightarrow$  (v), Consider the equation  $x^2 - (5 + \sqrt{2}) x + 5 \sqrt{2} = 0$ , where a = 1,  $b = -(5 + \sqrt{2}), c = 5\sqrt{2}$ , clearly  $a, b, c \in \mathbb{R}$ . Now  $D = b^2 - 4ac = \{-(5 + \sqrt{2})\}^2 - 4.1.5\sqrt{2} = (5 - \sqrt{2})^2$ .

Therefore  $x = \frac{5 + \sqrt{2} \pm 5 - \sqrt{2}}{2} = 5$ ,  $\sqrt{2}$  which do not form a conjugate pair.

Example 19 What is the value of  $\frac{i^{4n+1} - i^{4n-1}}{2}$ ? Solution *i*, because  $\frac{i^{4n+1} - i^{4n-1}}{2} = \frac{i^{4n}i - i^{4n}i^{-i}}{2}$  $= \frac{i - \frac{1}{2}}{2} = \frac{i^2 - 1}{2i} = \frac{-2}{2i} = i$ 

**Example 20** What is the smallest positive integer *n*, for which  $(1 + i)^{2n} = (1 - i)^{2n}$ ?

Solution n = 2, because  $(1 + i)^{2n} = (1 - i)^{2n} = \left(\frac{1 + i}{1 - i}\right)^{2n} = 1$   $\Rightarrow \qquad (i)^{2n} = 1$  which is possible if n = 2 ( $\therefore i^4 = 1$ ) Example 21 What is the reciprocal of  $3 + \sqrt{7}i$ 

Solution Reciprocal of  $z = \frac{\overline{z}}{|z|^2}$ Therefore, reciprocal of  $3 + \sqrt{7}$   $i = \frac{3 - \sqrt{7}i}{16} = \frac{3}{16} - \frac{\sqrt{7}i}{16}$ 

**Example 22** If  $z_1 = \sqrt{3} + i\sqrt{3}$  and  $z_2 = \sqrt{3} + i$ , then find the quadrant in which

 $\left(\frac{z_1}{z_2}\right) \text{ lies.}$ Solution  $\frac{z_1}{z_2} = \frac{\sqrt{3} + i\sqrt{3}}{\sqrt{3} + i} = \left(\frac{3 + \sqrt{3}}{4}\right) + \left(\frac{3 - \sqrt{3}}{4}\right)i$ 

which is represented by a point in first quadrant.

**Example 23** What is the conjugate of 
$$\frac{\sqrt{5+12i} + \sqrt{5-12i}}{\sqrt{5+12i} - \sqrt{5-12i}}$$
?

Solution Let

$$z = \frac{\sqrt{5+12i} + \sqrt{5-12i}}{\sqrt{5+12i} - \sqrt{5-12i}} \times \frac{\sqrt{5+12i} + \sqrt{5-12i}}{\sqrt{5+12i} + \sqrt{5-12i}}$$
$$= \frac{5+12i + 5 - 12i + 2\sqrt{25+144}}{5+12i - 5 + 12i}$$
$$= \frac{3}{2i} = \frac{3i}{-2} = 0 - \frac{3}{2}i$$

Therefore, the conjugate of  $z = 0 + \frac{3}{2}i$ 

**Example 24** What is the principal value of amplitude of 1 - i?

**Solution** Let  $\theta$  be the principle value of amplitude of 1 - i. Since

$$\tan \theta = -1 \Rightarrow \tan \theta = \tan \left(-\frac{\pi}{4}\right) \Rightarrow \theta = -\frac{\pi}{4}$$

**Example 25** What is the polar form of the complex number  $(i^{25})^3$ ? **Solution**  $z = (i^{25})^3 = (i)^{75} = i^{4 \times 18+3} = (i^4)^{18}$   $(i)^3 = i^3 = -i = 0 - i$ 

Polar form of  $z = r (\cos \theta + i \sin \theta)$ 

$$= 1\left\{\cos\left(-\frac{\pi}{2}\right) + i\sin\left(-\frac{\pi}{2}\right)\right\}$$
$$= \cos\frac{\pi}{2} - i\sin\frac{\pi}{2}$$

**Example 26** What is the locus of z, if amplitude of z - 2 - 3i is  $\frac{\pi}{4}$ ? **Solution** Let z = x + iy. Then z - 2 - 3i = (x - 2) + i(y - 3)Let  $\theta$  be the amplitude of z - 2 - 3i. Then  $\tan \theta = \frac{y - 3}{x - 2}$ 

$$\Rightarrow \qquad \tan\frac{\pi}{4} = \frac{y-3}{x-2} \left(\operatorname{since} \theta = \frac{\pi}{4}\right)$$

$$\Rightarrow \qquad 1 = \frac{y-3}{x-2} \text{ i.e. } x - y + 1 = 0$$

Hence, the locus of z is a straight line.

**Example 27** If 1 - i, is a root of the equation  $x^2 + ax + b = 0$ , where  $a, b \in \mathbf{R}$ , then find the values of *a* and *b*.

**Solution** Sum of roots  $\frac{-a}{1} = (1-i) + (1+i) \Rightarrow a = -2$ .

(since non real complex roots occur in conjugate pairs)

Product of roots, 
$$\frac{b}{1} = (1-i)(1+i) \Rightarrow b = 2$$

Choose the correct options out of given four options in each of the Examples from 28 to 33 (M.C.Q.).

**Example 28**  $1 + i^2 + i^4 + i^6 + ... + i^{2n}$  is

- (A) positive (B) negative
- (C) 0 (D) can not be evaluated

**Solution** (D),  $1 + i^2 + i^4 + i^6 + ... + i^{2n} = 1 - 1 + 1 - 1 + ... (-1)^n$ 

which can not be evaluated unless n is known.

**Example 29** If the complex number z = x + iy satisfies the condition |z+1| = 1, then z lies on

- (A) x-axis
- (B) circle with centre (1, 0) and radius 1
- (C) circle with centre (-1, 0) and radius 1
- (D) y-axis

Solution (C), 
$$|z+1|=1 \Rightarrow |(x+1)+iy|=1$$
  
 $\Rightarrow (x+1)^2 + y^2 = 1$ 

which is a circle with centre (-1, 0) and radius 1.

**Example 30** The area of the triangle on the complex plane formed by the complex numbers  $z_{z} - iz$  and z + iz is:

(A) 
$$|z|^2$$
  
(B)  $|\overline{z}|^2$   
(C)  $\frac{|z|^2}{2}$   
(D) none of these

Solution (C), Let z = x + iy. Then -iz = y - ix. Therefore, z + iz = (x - y) + i(x + y)

Required area of the triangle =  $\frac{1}{2}(x^2 + y^2) = \frac{|z|^2}{2}$ 

**Example 31** The equation |z+1-i| = |z-1+i| represents a

- (A) straight line (B) circle
- (C) parabola (D) hyperbola

**Solution** (A), |z+1-i| = |z-1+i|

$$\Rightarrow \qquad |z - (-1 + i)| = |z - (1 - i)|$$

- $\Rightarrow PA = PB, where A denotes the point (-1, 1), B denotes the point (1, -1) and P denotes the point (x, y)$
- $\Rightarrow$  z lies on the perpendicular bisector of the line joining A and B and perpendicular bisector is a straight line.

= 0

**Example 32** Number of solutions of the equation  $z^2 + |z|^2 = 0$  is

(A) 1 (B) 2 (C) 3 (D) infinitely many

**Solution** (D),  $z^2 + |z|^2 = 0, z \neq 0$ 

$$\Rightarrow \qquad x^2 - y^2 + i2xy + x^2 + y^2 = 0$$
  
$$\Rightarrow \qquad 2x^2 + i2xy = 0 \implies 2x (x + iy)$$

 $\Rightarrow$  x = 0 or x + iy = 0 (not possible)

Therefore, x = 0 and  $z \neq 0$ 

So y can have any real value. Hence infinitely many solutions.

Example 33 The amplitude of 
$$\sin \frac{\pi}{5} + i(1 - \cos \frac{\pi}{5})$$
 is  
(A)  $\frac{2\pi}{5}$  (B)  $\frac{\pi}{5}$  (C)  $\frac{\pi}{15}$  (D)  $\frac{\pi}{10}$   
Solution (D), Here  $r \cos \theta = \sin \left(\frac{\pi}{5}\right)$  and  $r \sin \theta = 1 - \cos \frac{\pi}{5}$ 

Therefore, 
$$\tan \theta = \frac{1 - \cos \frac{\pi}{5}}{\sin \frac{\pi}{5}} = \frac{2 \sin^2 \left(\frac{\pi}{10}\right)}{2 \sin \left(\frac{\pi}{10}\right) \cdot \cos \left(\frac{\pi}{10}\right)}$$
  
 $\Rightarrow \qquad \tan \theta = \tan \left(\frac{\pi}{10}\right) \text{ i.e., } \theta = \frac{\pi}{10}$ 

## 5.3 EXERCISE

## **Short Answer Type**

- 1. For a positive integer *n*, find the value of  $(1-i)^n \left(1-\frac{1}{i}\right)^n$
- 2. Evaluate  $\sum_{n=1}^{13} (i^n + i^{n+1})$ , where  $n \in \mathbb{N}$ . 3. If  $\left(\frac{1+i}{1-i}\right)^3 - \left(\frac{1-i}{1+i}\right)^3 = x + iy$ , then find (x, y).

4. If 
$$\frac{(1+i)^2}{2-i} = x + iy$$
, then find the value of  $x + y$ 

5. If 
$$\left(\frac{1-i}{1+i}\right)^{100} = a+ib$$
, then find  $(a, b)$ .

- 6. If  $a = \cos \theta + i \sin \theta$ , find the value of  $\frac{1+a}{1-a}$ .
- 7. If  $(1+i) z = (1-i) \overline{z}$ , then show that  $z = -i \overline{z}$ .
- 8. If z = x + iy, then show that  $z \overline{z} + 2(z + \overline{z}) + b = 0$ , where  $b \in \mathbf{R}$ , represents a circle.
- 9. If the real part of  $\frac{\overline{z}+2}{\overline{z}-1}$  is 4, then show that the locus of the point representing z in the complex plane is a circle.
- 10. Show that the complex number z, satisfying the condition  $\arg\left(\frac{z-1}{z+1}\right) = \frac{\pi}{4}$  lies on a circle.
- 11. Solve the equation |z| = z + 1 + 2i.

## Long Answer Type

12. If |z+1| = z+2(1+i), then find z.

- **13.** If  $\arg(z-1) = \arg(z+3i)$ , then find x-1 : y. where z = x + iy
- 14. Show that  $\left|\frac{z-2}{z-3}\right| = 2$  represents a circle. Find its centre and radius.
- 15. If  $\frac{z-1}{z+1}$  is a purely imaginary number  $(z \neq -1)$ , then find the value of |z|.
- $z_1$  and  $z_2$  are two complex numbers such that  $|z_1| = |z_2|$  and  $\arg(z_1) + \arg(z_2) =$ **16.**  $\pi$ , then show that  $z_1 = -\overline{z}_2$ .
- 17. If  $|z_1| = 1$   $(z_1 \neq -1)$  and  $z_2 = \frac{z_1 1}{z_1 + 1}$ , then show that the real part of  $z_2$  is zero.
- **18.** If  $z_1, z_2$  and  $z_3, z_4$  are two pairs of conjugate complex numbers, then find

$$\operatorname{arg}\left(\frac{z_1}{z_4}\right) + \operatorname{arg}\left(\frac{z_2}{z_3}\right).$$

arg 
$$\begin{pmatrix} z_4 \end{pmatrix}^+$$
 arg  $\begin{pmatrix} -z_1 \\ z_3 \end{pmatrix}^-$   
**19.** If  $|z_1| = |z_2| = ... = |z_n| = 1$ , then

show that 
$$|z_1 + z_2 + z_3 + \dots + z_n| = \left|\frac{1}{z_1} + \frac{1}{z_2} + \frac{1}{z_3} + \dots + \frac{1}{z_n}\right|$$

- 20. If for complex numbers  $z_1$  and  $z_2$ , arg  $(z_1) \arg(z_2) = 0$ , then show that  $|z_1 - z_2| = |z_1| - |z_2|$
- Solve the system of equations Re  $(z^2) = 0$ , |z|=2. 21.
- Find the complex number satisfying the equation  $z + \sqrt{2} |(z+1)| + i = 0$ . 22.
- Write the complex number  $z = \frac{1-i}{\cos \frac{\pi}{2} + i \sin \frac{\pi}{2}}$  in polar form. 23.
- 24. If z and w are two complex numbers such that |zw|=1 and  $\arg(z) \arg(w) =$  $\frac{\pi}{2}$ , then show that  $\overline{z} w = -i$ .

## **Objective Type Questions**

- **25.** Fill in the blanks of the following
  - (i) For any two complex numbers  $z_1$ ,  $z_2$  and any real numbers a, b,  $|az_1 - bz_2|^2 + |bz_1 + az_2|^2 = \dots$
  - (ii) The value of  $\sqrt{-25} \times \sqrt{-9}$  is .....
  - (iii) The number  $\frac{(1-i)^3}{1-i^3}$  is equal to .....
  - (iv) The sum of the series  $i + i^2 + i^3 + \dots$  up to 1000 terms is .....
  - (v) Multiplicative inverse of 1 + i is .....
  - (vi) If  $z_1$  and  $z_2$  are complex numbers such that  $z_1 + z_2$  is a real number, (vii)  $\arg(z) + \arg \overline{z}$  ( $\overline{z} \neq 0$ ) is .....

  - (viii) If  $|z+4| \le 3$ , then the greatest and least values of |z+1| are ..... and .....

(ix) If 
$$\left|\frac{z-2}{z+2}\right| = \frac{\pi}{6}$$
, then the locus of z is .....

- (x) If |z| = 4 and arg  $(z) = \frac{5\pi}{6}$ , then  $z = \dots$
- State True or False for the following : **26**.
  - The order relation is defined on the set of complex numbers. (i)
  - (ii) Multiplication of a non zero complex number by -i rotates the point about origin through a right angle in the anti-clockwise direction.
  - For any complex number z the minimum value of |z| + |z-1| is 1. (iii)
  - (iv) The locus represented by |z-1| = |z-i| is a line perpendicular to the join of (1, 0) and (0, 1).
  - (v) If z is a complex number such that  $z \neq 0$  and Re (z) = 0, then Im  $(z^2) = 0$ .
  - (vi) The inequality |z-4| < |z-2| represents the region given by x > 3.

(vii) Let  $z_1$  and  $z_2$  be two complex numbers such that  $|z_1 + z_2| = |z_1| + |z_2|$ , then arg  $(z_1 - z_2) = 0$ .

(iii)

(viii) 2 is not a complex number.

**ColumnA** 

27. Match the statements of Column A and Column B.

## Column B

- (a) The polar form of  $i + \sqrt{3}$  is
- (b) The amplitude of  $-1 + \sqrt{-3}$  is (ii) On or outside the circle having centre
- (c) If |z+2|=|z-2|, then locus of z is
- (d) If |z+2i| = |z-2i|, then locus of z is
- (e) Region represented by

 $|z+4i| \ge 3$  is

- (f) Region represented by  $|z+4| \le 3$  is
- (iv) Perpendicular bisector of segment joining (0, -2) and (0, 2).

(i) Perpendicular bisector of segment

joining (-2, 0) and (2, 0)

at (0, -4) and radius 3.

- (v)  $2\left(\cos\frac{\pi}{6} + i\sin\frac{\pi}{6}\right)$
- (vi) On or inside the circle having centre(-4, 0) and radius 3 units.
- (g) Conjugate of  $\frac{1+2i}{1-i}$  lies in (vii) First quadrant
- (h) Reciprocal of 1 i lies in (viii) Third quadrant

**28.** What is the conjugate of 
$$\frac{2-i}{(1-2i)^2}$$
?

29. If  $|z_1| = |z_2|$ , is it necessary that  $z_1 = z_2$ ? 30. If  $\frac{(a^2 + 1)^2}{2a - i} = x + iy$ , what is the value of  $x^2 + y^2$ ?

- **31.** Find z if |z| = 4 and arg  $(z) = \frac{5\pi}{6}$ .
- **32.** Find  $(1+i)\frac{(2+i)}{(3+i)}$
- **33.** Find principal argument of  $(1 + i\sqrt{3})^2$ .
- 34. Where does z lie, if  $\left| \frac{z-5i}{z+5i} \right| = 1$ .

Choose the correct answer from the given four options indicated against each of the Exercises from 35 to 50 (M.C.Q)

- **35.**  $\sin x + i \cos 2x$  and  $\cos x i \sin 2x$  are conjugate to each other for:
  - (A)  $x = n\pi$  (B)  $x = \left(n + \frac{1}{2}\right)\frac{\pi}{2}$

(C) 
$$x = 0$$
 (D) No value of  $x$ 

36. The real value of  $\alpha$  for which the expression  $\frac{1-i\sin\alpha}{1+2i\sin\alpha}$  is purely real is :

(A)  $(n+1)\frac{\pi}{2}$ (B)  $(2n+1)\frac{\pi}{2}$ (D) None of these, where  $n \in \mathbb{N}$ 

37. If z = x + iy lies in the third quadrant, then  $\frac{\overline{z}}{z}$  also lies in the third quadrant if

- (A) x > y > 0(B) x < y < 0(D) y > x > 0
- $(C) \quad y < x < 0 \qquad (D) \quad y > x > 0$

**38.** The value of (z + 3) ( $\overline{z} + 3$ ) is equivalent to

- (A)  $|z+3|^2$ (B) |z-3|(C)  $z^2+3$ (D) None of these
- **39.** If  $\left(\frac{1+i}{1-i}\right)^x = 1$ , then (A) x = 2n+1 (B) x = 4n(C) x = 2n (D) x = 4n + 1, where  $n \in \mathbb{N}$

**40.** A real value of x satisfies the equation  $\left(\frac{3-4ix}{3+4ix}\right) = \alpha - i\beta \ (\alpha, \beta \in \mathbf{R})$ if  $\alpha^2 + \beta^2 =$ (A) 1 (B) – 1 (C) 2 (D) -2**41.** Which of the following is correct for any two complex numbers  $z_1$  and  $z_2$ ? (A)  $|z_1 z_2| = |z_1| |z_2|$ (B)  $\arg(z_1z_2) = \arg(z_1)$ .  $\arg(z_2)$ (C)  $|z_1 + z_2| = |z_1| + |z_2|$ (D)  $|z_1 + z_2| \ge |z_1| - |z_2|$ 42. The point represented by the complex number 2-i is rotated about origin through an angle  $\frac{\pi}{2}$  in the clockwise direction, the new position of point is: (C) 2+i(D) -1+2i(A) 1 + 2i(B) -1 - 2i**43.** Let  $x, y \in \mathbf{R}$ , then x + iy is a non real complex number if: (D)  $y \neq 0$ (A) x = 0(B) y = 0(C)  $x \neq 0$ **44.** If a + ib = c + id, then (B)  $b^2 + c^2 = 0$ (D)  $a^2 + b^2 = c^2 + d^2$ (A)  $a^2 + c^2 = 0$ (C)  $b^2 + d^2 = 0$ The complex number z which satisfies the condition  $\left|\frac{i+z}{i-z}\right| = 1$  lies on **45**. (A) circle  $x^2 + y^2 = 1$ (B) the x-axis (C) the y-axis (D) the line x + y = 1. 46. If z is a complex number, then (A)  $|z^2| > |z|^2$ (B)  $|z^2| = |z|^2$ (C)  $|z^2| < |z|^2$ (D)  $|z^2| \ge |z|^2$ **47.**  $|z_1 + z_2| = |z_1| + |z_2|$  is possible if (B)  $z_2 = \frac{1}{z_1}$ (A)  $z_2 = \overline{z_1}$ (C)  $\arg(z_1) = \arg(z_2)$ (D)  $|z_1| = |z_2|$ 

**48.** The real value of  $\theta$  for which the expression  $\frac{1+i\cos\theta}{1-2i\cos\theta}$  is a real number is:

(A) 
$$n\pi + \frac{\pi}{4}$$
 (B)  $n\pi + (-1)^n \frac{\pi}{4}$ 

(C) 
$$2n\pi \pm \frac{\pi}{2}$$
 (D) none of these.

**49.** The value of arg (x) when x < 0 is:

- (B)  $\frac{\pi}{2}$ (D) none of these (A) 0
- (C) π

50. If 
$$f(z) = \frac{7-z}{1-z^2}$$
, where  $z = 1 + 2i$ , then  $|f(z)|$  is

(A)  $\frac{|z|}{2}$ (C) 2|z|

*Z*. none of these. (D)

(B)
